

Laterlite-Lightweight Concrete

I. About Laterlite

Laterlite is an Italian company that manufactures and develops lightweight insulating products for construction, civil engineering, geotechnical engineering, industrial uses, agriculture and landscaping. It's the first company that produced Light Expanded Clay Aggregate in Italy.

The company history began in 1964 when they first introduced lightweight expanded clay aggregates into Italy. Their research and development from the beginning was focused on creating innovative products based on the material in which they specialize: expanded clay. Currently, their range includes lightweight granular materials of various types, special concretes for structural applications, a range of screeds and mortars, and a wide selection of lightweight insulating blocks that are manufactured by Laterlite's sister company Lecasistemi.

Over these 50 years, Laterlite have produced and sold more than 50,000,000 cubic meters of expanded clay products: long experience that has made Laterlite the leader in its field, helping designers and construction professionals to choose lightweight insulating products for use in construction, sustainable renovation projects, and complex engineering products.
